EDUCATION

Rutgers University

B.S. Computer Science

Spring 2027

Middlesex College

A.S. Computer Science

Spring 2026

GPA: 3.91

TECHNICAL SKILLS

Java, Python, JavaScript, AWS, TypeScript, Apex, TensorFlow, Swift, CUDA, PyTorch, Apex, HTML/CSS, C++, C, React, Node.js, Axios, FastAPI, Salesforce LWC, Docker, Git, Linux, Kubernetes, Selenium, React, ONNX Runtime Web

EXPERIENCE

Software Engineering Intern | *Adobe*

Summer 2026

- Incoming Software Engineering Intern at Adobe for DX Content

Full Stack Engineering Intern | *Maximus*

Summer 2025

- Constructed a full-stack web application using React, Node.js, and PostgreSQL, handling 100,000+ monthly users and reducing page load times by 60% through dynamic component loading and database query optimization.
- Streamlined duplicate Java code across multiple codebases by identifying reusable patterns and abstracting common functionality into shared modules, improving maintainability and reducing redundancy by 18%.
- Reduced a 3500+ item technical debt backlog by developing automation scripts and leveraging machine learning techniques; accelerated triage and resolution process by 60% and improved overall code maintainability.

Software Engineering Intern | *Construction Specialties*

Summer 2024

- Created a custom Selenium-based automation tool to generate Apex unit tests, increasing Salesforce code coverage and reducing manual QA time by 70%, significantly accelerating deployment cycles and improving code reliability.
- Built a CI/CD pipeline with Bitbucket Pipelines, integrated automated testing, and environment-specific deployments, reducing QA-to-production release time by 350% and eliminating manual intervention.
- Developed internal Salesforce applications and tools using Apex and Lightning Web Components to streamline order tracking and unify client access, improving onboarding efficiency and reducing processing time by 40%.

PROJECTS

Machine Learning & Computer Vision Image Identifier | *Tensor Flow, Swift, C++*

- Deployed a scalable TensorFlow image classifier, containerized via Docker and orchestrated with Kubernetes, achieving 90%+ accuracy on diverse datasets.
- Integrated C++ for backend optimization, enhancing critical image processing algorithms and computations.
- Incorporated the trained model into an iOS app, allowing users to identify objects using their camera.

Black Scholes Model in Cuda | *C++, CUDA*

- Implemented a CUDA-based solution for the Black-Scholes model to compute fair call and put option prices.
- Performed an in-depth comparative analysis of CPU versus GPU performance, showcasing the substantial speedup achieved through parallel computing on the GPU.
- Modeled visualizations highlighting execution time differences between CPU and GPU, effectively illustrating the computational advantages of CUDA in financial modeling.

Rubik's Cube Solver | *TypeScript, React, PyTorch, Python, ONNX Runtime Web*

- Built a browser-based Rubik's Cube solver using TypeScript and React, implementing a custom group-theory cube model, layer-by-layer solving algorithm, and interactive 3D cube visualization.
- Developed a computer vision pipeline with PyTorch and ONNX Runtime Web for client-side cube recognition, reducing corner localization error from 6.2 px to 2.5 px using a custom heatmap-based CNN.
- Optimized solve performance with a BFS pattern database and bounded search, achieving a 100% solve rate across 1,200+ randomly scrambled cubes while averaging 110 moves per solution.
